To connect, you should put into operation the firmware version 1.6 or 1.7. This page is based on the ISO firmware version 7.4. Description System booting A basic overview of the requirements and possible booting errors. Selecting the bootable firmware (F) version is important when installing and updating the system. The following are the most important things to remember when selecting the firmware version: F1-F7 are the bootable versions of the firmware. The system supports firmware version F3 or F4. No customer has reported the bootable F1 or F2 versions. The system cannot boot from the factory version, the latest version or the rescue version. The system requires a UEFI BIOS with a bootable CMOS ROM. If you have a legacy BIOS, booting may not be possible or may be limited in some other way. The firmware version F1 is the factory version of the system. The firmware version F2 is the latest version of the system. The firmware version F3 is the first version of the firmware to boot. The firmware version F4 is the latest version of the firmware to boot. If the bootable version of the firmware is F1 or F2, the firmware is not bootable. If the firmware version is F3 or F4, it is bootable. The firmware version F1, F2, F3 and F4 can be seen on the boot menu, on the screen when booting the system, after selecting a firmware version, on the status page and in the log file. The firmware version F1 is not bootable, so you cannot boot the system from the firmware version F1. If you wish to do so, you can select the bootable version of the firmware and update the system to the latest version. The firmware version F2 is the latest version of the firmware, but it is not bootable. If you wish to boot the system from the firmware version F2, you can select the bootable version of the firmware and update the system to the latest version. Selecting the bootable version of the firmware is important because the system firmware can be updated. You must install the latest firmware version before updating the system. This is because the system only supports installing a firmware version after selecting it. During the initial system installation or 82157476af
